

## **IN THE SPECIFICATION**

Please amend paragraph [0096] at page 55, beginning at line 16 as follows:

Thereafter, when there is an access from the user through the portable telephone 1, the processing for distributing the portal site peculiar to the user is performed (step S34 of FIG. 9). This operation will be described in detail. First, when the user selects the Internet connection (step S152 of FIG. 12) from the top menu showing the functions of the portable telephone 1 (step S151 of FIG. 12), the terminal of the portable telephone 1 reads out the URL recorded by the ~~portal site data providing device 2~~ data providing system as described above from the SIM card (steps S153, S154 of FIG. 12) as described above. Using the URL, an access is made to the data managing server 3 as the connection target (step S155 of FIG. 12). There may be portable terminals which do not read out the URL stored in the SIM card at the time of making an access to the Internet, depending on the types. In such a case, the data managing server 3 distributes the URL transmitted by a short mail service (SMS) or an E-mail after programming it to be recorded in a local region based on the information on the type of the portable terminal inputted by the user. Thereby, the portable telephone 1 reads out the URL stored in the local region for making an access to the portal site.
